

## Bio Green Premium Turf Maintenance Program

### Your Current Lawn Conditions...

This program is ideal if you have an established Lawn with 1 or more issues, which may include – bare spots, grubs, disease, nutsedge, weeds, excessive thatch, soil compaction, or insects.

### Goal...

This is our top (premium) maintenance program, designed to deal with all of your turf issues at no additional cost.

### Early Spring applications...

- Moderate-rate balanced fertilization to improve density
- Slow-release nitrogen, 30% SCU (sulphur-coated urea)
- Pre-emergent crabgrass control
- Spot weed control.

### Spring applications...

- Moderate-rate balanced fertilization to improve density
- Slow-release nitrogen – 30% SCU (sulphur-coated urea)
- Pre-emergent crabgrass control
- Iron and micronutrients
- Broadleaf weed control
- **Coring aeration to control thatch and stimulate root growth.**

### Early Summer applications...

- Moderate-rate fertilization to help maintain good color and healthy root system
- Slow-release nitrogen – 50% SCU (sulphur-coated urea)
- Surface insect control
- Japanese beetle grub control (preventative)
- Broadleaf weed control
- Yellow nutsedge control.

### Summer applications...

- Moderate-rate potash feeding for disease and drought resistance
- Surface insect control
- Broadleaf weed control
- Check for thatch accumulation
- Disease and fungus control.

### Fall applications...

- Heavy-rate, balanced fertilization
- Slow release nitrogen – 30% S.C.U (sulphur-coated urea)
- Slice aeration and seeding for bare/thin spots (includes up to 20% of your lawn area)
- Spot weed control.

### Late Fall and Winter applications...

- Winterizer fertilizing high in nitrogen to promote a deep root system and early spring green-up
- Broadleaf weed control
- Soil amendments – to provide a better environment for roots (optional at nominal additional cost). A soil amendment is adding of any material to your soil to improve its physical properties, including its water retention, permeability, drainage, aeration, structure, and the relative water infiltration rate (*Infiltration refers to the movement of water into the soil layer, and the rate of this movement is called the infiltration rate. If rainfall intensity is greater than the infiltration rate, water will accumulate on the surface, resulting in run-off.*)
